

Create S60 applications with C# and Visual Basic

Net60, from Red Five Labs, is the de facto .NET framework for S60. Net60 enables mobile applications built with the .NET Compact Framework 2.0 for Windows Mobile to run on Symbian S60 3rd and 5th edition devices.

Red Five Labs has implemented the Common Language Infrastructure (commonly referred to as .NET) on the Symbian platform. The .NET runtime is analogous to the Java Virtual Machine. Instead of writing native Symbian C++ code for the underlying Symbian operating system, .NET developers write managed C# or Visual Basic code targeting this managed execution environment which is common to Symbian and Windows Mobile.
