

Category:Device_Management

This page lists all the articles in the Forum Nokia Wiki that include the category **Device Management**

Device management (DM) is a generic term for the systems that can be used by or on behalf of users to configure, manage, install, and update applications and network access settings in mobile devices. With device management, an operator, service provider, or enterprise can help users to use new services and applications, as well as modify existing configurations.

By simplifying configuration, device management offers benefits to everyone in the mobile value chain. It is a key success factor for any organization that has a large number of mobile devices that need to be managed. Device management enables cost-effective service management and efficient use of mobile services.
