

Category:Flash_Lite_Components

Components created for Flash are typically not ideal for Flash Lite due to challenges presented by lack of memory or processing speed in the handset. To meet these challenges, please find here a library of components optimised for mobile usage.

We'd really like to grow this initial library into something much larger! Try out some of the existing [components](#) to see how those will ease your creation workflows, and contribute some new components that you think will be useful for others. (be sure to check the instructions and guidelines first).

If you have questions and comments about the guidelines, you may want to take a peek at the [Flash Lite discussion board](#) activity and participate.
