

This page presents all the articles in the Forum Nokia Wiki that include the category **Mobile Web Server**. If new to this technology, besides some basic information presented here, check also the [Mobile Web Server Landing Page](#) in Forum Nokia.

Introduction

Mobile Web Server is a concept developed by Nokia Research Center. The server available from [mymobilesite.net](#) is a next step towards an easy-to-use and easy-to-develop system. The concept provides, for example, a Nokia gateway infrastructure for HTTP connectivity to devices; an easy registration of your own domain name; a Nokia signed MWS S60 software download; ready-made content that allows users to easily use, create content, and browse it immediately after setup; a web cache; an SSL connection security; and an authentication system for accessing the terminal content. The mobile server is open for HTML content and application development with [Apache technology](#) and [Python](#) programming environment.
