

This tool is used for requesting a Developer certificate from www.symbiansigned.com. It asks for details about the certificate to be created, then produces a *.csr file which can be uploaded to the Symbian Signed website to request the certificate.

It can be downloaded from here: [Symbian DevCert Request Tool for Windows](#), either as a stand-alone application, or as a plugin for [Carbide.c++](#).

Installing the plugin version for Carbide

As the instructions for installing the plugin on the [Symbian](#) site are a bit vague, here is a list of steps that should work:

1. Download the "DevCert Request Plugin for Eclipse" from [here](#).
2. Extract the .zip file with directories to a temporary folder
3. Copy the contents of the *dev* subdirectory (that is, the folders named *com.symbian.devservices.devcertrequest_1.0.5* etc.) to *\Program Files\Nokia\Carbide.c++\v1.2\plugins* (or wherever your Carbide installation lives)
4. Restart Carbide - after this, a Tools menu should appear that contains nothing but the "[Symbian Signed](#)" submenu, where you will find the new tool.

If the plug-in does not appear when you restart [Carbide.c++](#), close [Carbide.c++](#) and restart it from the command line using the clean switch (e.g. `carbide.c++.exe -clean`). This resets the plug-in information in [Carbide.c++](#) and you should now see the plug-in as described above.
