

How_to_detect_HTTP_connection_break

Many a times HTTP connection breaks due to some reasons. The connection may be WIFI or HTTP. Applications should be well equipped to catch these connection breaks. The HTTP Client source codes on [ForumNokia](#) comes along with the code to catch these connection breaks. The older version of this example missed this feature.

The **CIAPConnectProgressNotifier** class implements this.

```
iConnection.ProgressNotification(iProgress, iStatus);  
SetActive();
```

if the connection breaks

```
void CIAPConnectProgressNotifier::RunL()
```

RunL will give the exact state of the connection.
