

The code below shows starting an exe from other application.

A handle to a process.

```
RProcess server;
```

Starts a new process, loading the specified executable.

```
server.Create(KServerName, KNullDesC);
```

Create an empty command line object.

```
CApaCommandLine* ApacommandLine = CApaCommandLine::NewL();
```

Sets the executable name from the specified descriptor

```
ApacommandLine->SetExecutableNameL(KExecutableName);
```

Important : Assigns a command line to a process (EKA2 only). This replaces the EKA1 method which involved retrieving the full command line (using **CApaCommandLine::FullCommandLine()**) and passing it to the process (or thread on the emulator).

```
ApacommandLine->SetProcessEnvironmentL(server);
```

```
RApaLsSession Session;  
Session.Connect();  
Session.StartApp(*ApacommandLine);  
Session.Close();
```

```
delete ApacommandLine;
```
