Overview

The meta element, which can be used to control caching, is part of the XHTML MP specification but is not always supported.

Symptoms

Description

The Nokia 3650 and Nokia N-Gage ? game deck ship with a dual-mode browser, which supports XHTML Mobile Profile (XHTML MP). The meta element, which can be used to control caching and refreshing content, is part of the XHTML MP specification but is not supported in these devices.

How to reproduce

Create an XHTML page that includes the meta element to prevent caching of the page. Because the meta element is not supported by the browser, caching cannot be prevented using it.

Solution
