## Description

Most of the XHTML browsers do not support the font size tag if pixel measurements are used. For example, `style="font-size:10px"` is not supported. It is, however, possible to change the font size, but not using pixels. Note that the XHTML standard does not require font size tag support with pixel measurements.

Here is an example:

```
<style type="text/css">
.small { font-size:small; }
.medium { font-size:medium; }
.large { font-size:large; }
</style>
```

Or it can also be added directly to the code

```
<big>Big</big> normal <small>small</small>
```

## Solution

Pixel font sizing does not work. Use another method for font sizing.
