

Numeric_key_codes_for_E71

E71 doesn't send the scan codes for number keys so the same has to be translated from the scan codes to get the numeric keys.

```
TInt CYourContainer::OfferKeyEventL(const TKeyEvent& aKeyEvent, TEventCode aType)
{
    TInt key = aKeyEvent.iScanCode;
    switch (key)
    {
    case 'R':
        = '1';           key
    case 'T':
        = '2';           key
    case 'Y':
        = '3';           key
    case 'F':
        = '4';           key
    case 'G':
        = '5';           key
    case 'H':
        = '6';           key
    case 'V':
        = '7';           key
    case 'B':
        = '8';           key
    case 'N':
        = '9';           key
    case 'M':
        = '0';           key
    case 'U':
        = '*';           key
    case 'J':
        = EStdKeyHash;   key
    default:
        = key;           key
    }
}
```

The key mapped after this would have the numeric keys. The same would be useful for a developer writing dialer applications/number selection/entering dialogs, or any other cases where they want to take the numeric key inputs.
