

The tables below show S60 identification codes. There are three types of identification codes, viz.,

- **Platform ID**
- **Product ID**
- **Machine UID**

The Platform ID and Product ID are usually used in the package file (.pkg) to perform checking during installation. For example, an installation file can display warning if a user is trying to install it on incompatible platform or device.

The Machine UID is usually used in the code during runtime. The API to get Machine UID in C++ is `HAL::Get (HAL::EMachineUid)`. It is also possible to check Machine UID during installation using `IF` statement in the .pkg file.
