

## Stray\_signal

**Reviewer Approved**

With respect to the Active object framework in Symbian OS, Stray signal is a panic which is defined as **E32USER-CBase 46**.

There are following cases when stray signal may occur:

- **CActiveScheduler::Add()** was not called when the active object was constructed (it cause **E32USER-CBase 49**).
- **SetActive()** was not called following the submission of a request to the asynchronous service provider.
- The asynchronous service provider completed the **TRequestStatus** of an active object more than once ? either because of "when an already-completed request is canceled" or "more than one request was submitted simultaneously on the same active object."
