

## Talk:Autostart\_applications\_on\_S60\_2nd\_Edition\_phones

- Note: don't just copy the demo without modification! e.g. the Timer has not been closed!

---

This article merely represents an approach to auto-start an application on boot-up on S60 2nd Edition phones. Some applications need to get started when we switch on our mobile for e.g. an application which asks for the security password. The article illustrates this approach without using "Start on Boot Registration API" plug-in provided by Symbian.

Whatever the changes we need to make in our .mmp file, .pkg file, header file and .cpp file are all contained in this article. Some tips are also given in the end for making it effective. I really appreciate author's ideas.

This article can be helpful to intermediate developers who need to add this feature in their application.
