

Talk:How_to_use_the_CAkWaitDialog

The example would be more complete if it defined also the resource structure (R_TEST_WAITNOTE or the resource with id "1"). In this form compiling and running the code results in a guaranteed panic, BAFL or similar. --[Mrtj](#) 11:14, 25 August 2008 (EEST)

Actually the resource could look like this:

```
RESOURCE_DIALOG r_test_waitnote
{
    flags      = EAknWaitNoteFlags;
    buttons    = R_AVKON_SOFTKEYS_CANCEL;
    items =
    {
        DLG_LINE
        {
            type      = EAknCtNote;
            id        = EMyWaitNoteId;
            control = AVKON_NOTE
            {
                layout          = EWaitLayout;
                singular_label = "Wait...";
                plural_label   = "";
                animation       = R_QGN_GRAF_WAIT_BAR_ANIM;
            };
        }
    };
};
```

You should define EMyWaitNoteId in your hrh. --[Mrtj](#) 17:01, 25 August 2008 (EEST)
