

XML

XML is short for - Extensible Markup Language (XML) is a general-purpose markup language.

Its primary purpose is to facilitate the sharing of data across different information systems, particularly via the Internet. It allows for the separation of content from layout and delivery mechanism. XML documents do not contain information on how to display the data, but using CSS or XSL it can be done.

It is very important to understand that XML was created to structure, store and to send information. Using XML it's possible to separate data from XHTML/HTML
